

VAS Analysis 15 to 25th Sept

Below several self explanatory charts.

Key inferences from charts and inspection of detailed data are:

- a. Marked differential in traffic volumes weekday cf weekend (about 50% more on a week day)
- b. Peak volumes in week in period 3pm to 6pm
- c. 85% of vehicles travel at less than 31mph
- d. Proportion breaking speed limit on weekdays is c 20% ; at weekends is c17%
- e. Some weak evidence that speeding has reduced across the period by a modest amount
 1. See chart for average speeds by week; perhaps a reduction of 0.5mph to 1mph, on average in peak period
 2. The proportion of speeding traffic at peak volumes has reduced from a range of 20% to 30% to a range of 10% to 25%

Caution; some data period possibly affected by bank holiday and the week on week comparison is not complete
